91	Mission-Based Information Types and Delivery Mechanisms: Mission Areas and Information Types [Services for Citizens]	D.1 Defense & National Security												
92	Department of the Navy - Specific	D.1.1 Strategic National & Theater Defense												
			Cryptography is encryption of mission related data or information; the storage or transmission of data so as to render it accessible to only those intended to have access. The use of deception and mathematics to hide data, to render data unintelligible, the transformation of data into an unreadable state and to ensure the integrity of the message in transit unaltered when received and then to make provision for encrypted data transformed into a readable state. Functions also include nonrepudiation of receipt and authentication of the source ensuring that the message has been received. Cryptography includes the means of encryption and the product of applying encryption techniques. Specifically approved encryption methodology, algorithms, applications or devices authorized by the cognizant Authorizing Official or the National Security Agency for the specific mission needs. Key generation, distribution and management are often necessary components of cryptography.					X						
93	Department of the Navy - Specific	D.1.1.1 Cryptographic							N/A	N/A	N/A	High	High	High
94	Department of the Navy - Specific	D.1.1.2 Cryptologic	Cryptology is the study of cryptography and cryptanalysis.					X	N/A	N/A	N/A	High	High	High
95	Department of the Navy - Specific	D.1.2 Operational Defense												
			Identify environmental conditions that impact on strategic airlift, sea lift, and/ or other operations. Weather, oceanic, and the space environment are some of the conditions which may delay, divert, change, or cancel strategic airlift, sealift, and/or other operations. This task includes recommending changes in transportation modes, assets, or routing to minimize impact or exploit favorable conditions to enhance mission success. Secondly, it includes assessing Meteorological and Oceanographic (METOC) (to include space) information and identify impacts of METOC on employment of nuclear weapons to combatant command missions. Perform consequence analysis and consequences of execution for nuclear weapons. Thirdly, it includes the assessment and report strategic intelligence of immediate value relating to particular areas of concern to the Secretary of Defense and national strategic planners. This task includes the preparation of intelligence estimates and assessments and periodic intelligence briefings and reports. - Natural environmental factors, including climatic design type, terrain, meteorological and oceanographic (METOC) factors, impacts and effects.	X	X		X							
96	Department of the Navy - Specific	D.1.2.6 Meteorological and Oceangraphic (METOC)							N/A	N/A	N/A	Moderate	Moderate	Moderate
97	Department of the Navy - Specific	D.1.3 Tactical Defense												
			Communications Control” are functions that facilitate the use of communications systems. The objective of the communications system is to assist the force commander (FC) in command and control (C2) of military operations. C2 is vital for proper integration and employment of DON capabilities. The DON capabilities functions are part of the Department of Defense’s (DOD’s) end-to-end communications system and support the FC as integrated into the Department of Defense information network (DODIN). The DODIN is the set of information capabilities, and associated processes to collect, process, store, disseminate, and manage information on demand to warfighters, policy makers, and support personnel, whether interconnected or stand-alone, including owned and leased communications and computing systems and services, software (including applications), data, security services, other associated services, and national security systems. Cyberspace operations (CO) include offensive cyberspace operations (OCO), defensive cyberspace operations (DCO), and DODIN operations. All of this is the communications system subject to communication control.					X						
98	Department of the Navy - Specific	D.1.3.1 Communication Control							N/A	N/A	N/A	Moderate	Moderate	Moderate

	Category (Per NIST SP 800-60)	Information Types (Per NIST SP 800-60)	Description						NIST			DON		
				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
99	Department of the Navy - Specific	D.1.3.2 Radar Tracks (including triggers-azimuth-video, correlated/merged radar tracks, track ID doctrine, etc.)	Radar tracks are sets of data representative of accumulated information correlated to form the history of a radar contact detected in space [air, land, sea and space (exoatmospheric space)]. Measurements made by radar used to form radar tracks include relative position in terms of range, azimuth, altitude, direction of motion, and speed. As information is associated then correlated from one or more radar source, a radar track file is developed and is used to store information for comparison, analysis, retrieval, and display of the immediate position, kinematic (behavior) history and sometimes the projected future kinematics of a radar contact. Track file data is sometimes used to derive radar contact identification. Radar tracks are not to be confused with targets.	X	X		X		N/A	N/A	N/A	High	High	High
100	Department of the Navy - Specific	D.1.3.3 Navigation (GPS data, Inertial navigation/gyroscopic data, etc.)	Information and information sources used for the purpose of establishing platform position and time includes sources such as military grade space based Global Positioning System secured by employing Selective Availability Anti-Spoofing Module (SAASM). Inertial Navigation and Gyroscopic capability are used to provide information regarding relative position in a three dimensional geometry and time permitting precise determination of intentional platform motion and measuring effects of the environment such as pitch, yaw, roll and crabbing caused by influence of the medium (air and water) in motion on the platform. Navigation information may be used for gross navigation of the platform or precision control of movement required to control, land or dock an unmanned vehicle in air or at sea.	X	X		X		N/A	N/A	N/A	High	High	High
101	Department of the Navy - Specific	D.1.3.4. Weapons Release	Weapons Release is the establishment of conditions (weapons status and rules of engagement) permitting the freedom to fire kinetic effects including the command and the execution of control of a weapon. To employ fires is to use available weapons and other systems to create a specific lethal or nonlethal effect on a target. Fires typically produce destructive effects, but various nonlethal ways and means (such as electronic attack [EA]) can be employed with little or no associated physical destruction	X	X		X		N/A	N/A	N/A	High	High	High
102	Department of the Navy - Specific	D.1.3.5. Target	Targeting supports the process of linking the desired effects of fires to actions and tasks at the component level. Commanders and their staffs must consider strategic and operational objectives, the potential for fratricide and other undesired fires effects, legal limitations (e.g., constraints and restraints), and rules of engagement, when making targeting decisions. Successful integration of information operations (IO) considerations into the targeting process is important to mission accomplishment in many operations.	X	X		X		N/A	N/A	N/A	High	High	High
103	Department of the Navy - Specific	D.1.3.6 Battle Damage Assessment	The estimate of damage composed of physical and functional damage assessment, as well as target system assessment, resulting from the application of lethal or nonlethal military force or kinetic fires Also called Battle Damage Assessments (BDA).	X	X		X		N/A	N/A	N/A	Moderate	Moderate	Moderate
104	Department of the Navy - Specific	D.1.3.7 Precision Airborne Distance Measurement Equipment (DME/P)	A system for measuring the distance between an aircraft and a ground beacon station comprising a generator of interrogation pulses for transmission to the beacon station; and a receiver for receiving reply pulses from the beacon station, and for converting the received pulses into data representative of the distance between the aircraft and beacon station. The apparatus further includes high precision distance measuring apparatus comprising a modulator means for imposing notches on the interrogation pulses; means for receiving a special reply pulse from the beacon station; and computer means for generating data representative of the elapsed time between the first pulse notch and reception of the special reply pulse. DME/P provides the precision slant range function to complement the azimuth and elevation guidance for precision approach and landing for all types of aircraft through Microwave Landing System (MLS) coverage volume.					X	N/A	N/A	N/A	Low	Moderate	Moderate
105	Department of the Navy - Specific	D.1.3.8 Standard Tactical Air Navigation (TACAN) Signal	A tactical air navigation system, commonly referred to by the acronym TACAN, is a legacy navigation system used by military aircraft. It provides the user with bearing and distance (slant-range) to a ground or ship-borne station. Distance Measuring (DME) portion of the TACAN system is available for civil use; at VORTAC facilities where a Very High Frequency (VHF) omnidirectional range (VOR) is combined with a TACAN, civil aircraft can receive VOR/DME readings.					X	N/A	N/A	N/A	Low	Moderate	Moderate

				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
106	Department of the Navy - Specific	D.1.3.9 Identification Friend or Foe (IFF) (MODE 1,2,4)	Identification Friend or Foe (IFF) is an Air Traffic Control Radar Beacon System (ATCRBS) used to cooperatively identify friends, neutrals and commercial aircraft. Note, contrary to its nomenclature, IFF does not identify enemy/hostiles and unknowns. IFF is a secondary surveillance radar (SSR) system and is also used to identify surface radar contacts in real-time. Mode 1 and 2 provide low confidentiality military identification codes. Mode 3/A is the civil code used to identify non-military or non-combat platforms. Mode 3/C provides a code representative of approximate altitude of the squawking platform. Mode 4 provides a low confidentiality encrypted code for military equipment not updated to Mode 5. In addition to air traffic control (by government and commercial entities, as well as for tracking commercial air in the battlespace, IFF is used for martialing aircraft and for deconfliction of the order of battle when weapons are used in an operational theater with friends and neutrals in the battle space.					X	N/A	N/A	N/A	Low	High	High
107	Department of the Navy - Specific	D.1.3.9.1 Mode 5 (Secure)	Mode 5 is a cryptographic upgrade to Identification Friend or Foe (IFF) used to cooperatively identify friends intended to minimize the potential for fratricide. Note, contrary to its nomenclature, IFF does not identify enemy/hostiles and unknowns. IFF is a secondary surveillance radar (SSR) system and is also used to identify surface radar contacts in real-time. In addition to air traffic control of military aircraft, Mode 5 equipped IFF is used for martialing aircraft and for de-confliction of the order of battle when weapons are used in an operational theater with friendly aircraft in the battle space. Military surface platforms are also equipped with Mode 5. The IFF Mode 5 capability is the sole means of positive friend identification other than line of sight visual identification and all other means are less than positive.					X	N/A	N/A	N/A	High	Moderate	Moderate
108	Department of the Navy - Specific	D.1.3.10 Indications and Warnings	Indications and Warnings are the product of an intelligence system of systems intended to produce understanding of the operational environment including: political, military, economic, social, information, and infrastructure (PMESII). Indications and Warnings result from collaboration with various intelligence organizations, United States Government departments and agencies, and nongovernmental centers that possess relevant expertise. Intelligence analysts identify potential sources from which to gain indications and warning, and facilitate understanding of the continuous and complex interaction of friendly, adversary, and neutral systems to aid world-wide national, regional and theater commanders in execution of their missions.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
109	Department of the Navy - Specific	D.1.3.11 Threat Indications from Radar Warning Indicator	A radar warning indicator is a function of a radar warning receiver system designed to warn an aircraft's crew of potentially hostile radar activity. It is an airborne threat warning and countermeasures control system.					X	N/A	N/A	N/A	Low	High	High
110	Department of the Navy - Specific	D.1.3.12 HM&E Machinery Plant Data (Sensors, Motors, Controllers, Processors, Valves, etc.)	The Hull, Mechanical & Electrical (HM&E) is defined as the organic platform systems that establish and maintain Power, Propulsion, Steering, Damage Control, and Interior Communications which include the infrastructures the following systems rely upon for the continual transfer of Machinery Plant Data. • Machinery Control System • Steering Control System • Electric Power Systems • Damage Control and Firefighting • Auxiliary Machinery and Fluid Systems • Maneuvering, Hydraulics, Hull Outfitting & Habitability • Propulsion System • Auxiliary Systems (Air Compressors, Alarms, Drain and Ballast, Degaussing, etc.)		X				N/A	N/A	N/A	Moderate	High	High
111	Department of the Navy - Specific	D.1.3.13 System Track	Track formed from the integration of one or more sources that is used for display and C2 decisions; object does not exist in the physical world but is simulated; training tracks					X	N/A	N/A	N/A	High	High	High
112	Department of the Navy - Specific	D.1.3.14 Source Track	Track reported by a specific source; sensor measurement; (i.e. raw data coming directly from the sensor); SARTIS					X	N/A	N/A	N/A	High	High	High
113	Department of the Navy - Specific	D.1.3.15 Engagement	Data/information utilized to engage target (e.g. engagement order, engagement status, negative engagement order); Track that has been ordered for engagement					X	N/A	N/A	N/A	High	High	High
114	Department of the Navy - Specific	D.1.4 Tactical Offense												

	Category (Per NIST SP 800-60)	Information Types (Per NIST SP 800-60)	Description						NIST			DON		
				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
115	Department of the Navy - Specific	D.1.4.1 Jamming Signals	Jamming signals are employed to suppress or confuse radio frequency (RF) based systems such as but not limited to navigation systems, communications systems or radar systems. Jamming can take many forms such a: overpowering or saturating receivers preventing detection of intended signals, flooding receivers with meaningless information rendering it incapable of distinguishing authentic signals.					X	N/A	N/A	N/A	High	High	High
116	Department of the Navy - Specific	D.1.4.2 MECONING	MECONING is the practice of giving false signals to navigation systems to deceive an enemy's operations. MECONING is accomplished by the interception and rebroadcast of authentic navigation signals. MECONING signals are rebroadcast on the received frequency, typically, with power higher than the original signal, to confuse enemy navigation. The resulting effect is enemy aircraft or ground stations are given inaccurate bearings.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
117	Department of the Navy - Specific	D.1.4.3 Spoofing	Spoofing is an information warfare technique intended to deceive or exploit through masquerading as an enemies' cyberspace information exchanges or signals in space. Masquerading or falsifying information or signals (spoofing) is employed to gain access, to propagate misinformation, to erode confidence, to distract or to manipulate enemy forces and capabilities.					X	N/A	N/A	N/A	Moderate	High	Low
118	Department of the Navy - Specific	D.1.4.4 Radar Track Capture and Manipulation	The practice of reducing the effectiveness of opposing forces' radar systems through transmission of deceptive signals. Radar track capture occurs when radar systems receive deceptive signals representing pseudo radar contacts or false radar contact position causing them to accept these and to shift their operations to a pseudo track or to cause an offset of perceived radar contact position from actual position. The manipulation effect is often intended to achieve a soft-kill of a radar guided hard-kill weapon such as an air-to-air or a surface-to-air missile or fire control system.					X	N/A	N/A	N/A	High	Moderate	Moderate
119	Department of the Navy - Specific	D.1.4.5 Psychological Operations	The specific purpose of psychological operations (PSYOP) is to influence foreign audience perceptions and subsequent behavior as part of approved programs in support of United States Government policy and military objectives. To be effective, all DOD communications efforts must inherently support the credibility, veracity, and legitimacy of USG activities. PSYOP forces operate across the range of military operations. PSYOP activities conducted at the operational level generally support the implementation of regional policies and military plans. Tactical PSYOP activities normally are conducted in support of local military or civil authorities. The synchronization of PSYOP with all other actions of the US and multinational forces precludes messages or actions at one level from contradicting or weakening the effectiveness at another.					X	N/A	N/A	N/A	High	High	Moderate
120	Department of the Navy - Specific	D.1.4.6 Enemy Network Offensive Operations	The United States Government (USG) recognizes the threat of enemy operations directed against the Department of Defense Information Networks (DoDIN) as a real-world probability if not already an actual real and present danger. Hostile acts in cyberspace are recognized as an act of war and may have catastrophic consequences in the most extreme cases of full spectrum cyber-attack, similar to the launching of a nuclear attack. Information pertaining to the methods, actors, prevention, detection, response, recovery, foreign cooperative agreements, international law, and deterrence are all a part of this information type.					X	N/A	N/A	N/A	High	High	High
121	Department of the Navy - Specific	D.1.4.7 Exfiltration of Foreign Information	Exfiltration of Foreign Information is an offensive espionage tactic of information warfare or offensive cyber operations (OCO): intended to achieve information dominance through clandestine access, probing and capture of information hosted in enemy information systems. A broad range of cyber warfare techniques may be used to collect targeted information which may be only specific predefined items or may include massive databases. The subject is also of interest from a cybersecurity or defensive posture in determining both how to defend United States Government (USG), United States (commercial) and private information systems and in the performance of cybersecurity forensics. 				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
			Battleforce status and asset availability are information required to support execution of the mission. Force visibility provides the current and accurate status of forces at the strategic and operational level, their current mission, future missions, location, mission priority, and readiness status. Force visibility provides information on the location, operational tempo, assets, and sustainment requirements of a force as part of an overall capability for a commander. Asset visibility provides commanders and planners with timely and accurate information of the availability of assets; the location, movement, status, and identity of units, personnel, equipment (maintenance and retrograde actions), and supplies by class of supply, nomenclature, and unit during deployment operations. The commander's estimate of the operational environment and articulation of the objectives needed to accomplish the mission form the basis for determining components' objectives. The commander uses the assigned operations and mission, commander's estimate and objectives, commander's intent, concept of operations (CONOPS), the reported operational condition and inventory of mission capable resources available to execute the battleforce and the components' objectives to develop a course of action (COA). When the commander approves the battleforce COA, it becomes the basis for more detailed joint operations planning—expressing what, where, and how operations will affect the adversary or current situation. The battleforce's daily guidance ensures that operations effectively support the battleforce objectives while retaining enough flexibility in execution to adjust to the dynamics of military operations.					X	N/A	N/A	N/A	High	High	High

127	Department of the Navy - Specific	D.1.5.1 Autonomic Logistics						X	N/A	N/A	N/A	High	High	Moderate
128	Department of the Navy - Specific	D.1.5.2 Status of Onboard Stores	Status of onboard stores is the tracking, display and communication of the condition and availability of material available to an operator or a commander of a tactical unit. Stores are the equipment, armament and other material load out packages mounted on a platform for the execution of an assigned mission.					X	N/A	N/A	N/A	High	High	Moderate
			Forward deployed logistics is the information describing the material resources available to a commander in the theater of operations. The timeliness and corresponding success of United States (US) response is a function of US forward deployed forces and pre-positioned assets, forces with organic movement capability, and adequate strategic and intratheater mobility capability assets. Understanding the capabilities of the theater infrastructure and the time when assets become available is crucial for developing successful deployment operations. An infrastructure assessment is essential for understanding the capabilities and limitations of the operational area to support deployment operations. The assessment serves as a basis to determine the forces, equipment, and materiel that must be deployed and the facility upgrades required to enhance operations. Infrastructure consists of the physical network and the resource network.					X	N/A	N/A	N/A	High	Moderate	Moderate

132	Department of the Navy - Specific	D.1.6 Command and Control												
133	Department of the Navy - Specific	D.1.6.1 Unmanned Platform Control	Unmanned aircraft systems (UASs) should be treated similarly to manned systems with regard to the established doctrinal warfighting principles. Several characteristics of UASs can make C2 particularly challenging: • UAS communication links are generally more critical than those required for manned systems. • UASs may be capable of transferring control of the aircraft and/or payloads to multiple operators while airborne. • Most larger UASs have considerably longer endurance times than comparable manned systems. • Compliance with the airspace control order is critical. Unlike manned aircraft, UASs cannot typically "see and avoid" other aircraft. All unmanned aircraft (UA) operators must adhere to approved operational procedures including airspace control through positive or procedural methods. The mix of friendly, adversary, and neutral aircraft and mission constraints may require the Force Commander (FC) to strictly control flights in the operational area. In such situations, the Force Air Component Commander (FACC) may elect to augment forward theater air ground system (TAGS) elements with additional planning personnel, training, and capabilities. UASs may be capable of transferring control of the aircraft and/or payloads to multiple operators while airborne. Clear transfer of authority and close coordination amongst all potential operators is required.					X	N/A	N/A	N/A	High	High	High
134	Department of the Navy - Specific	D.1.6.2 Order of Battle	Space orders of battle. The Force Commander (FC) provides guidance, priorities, and objectives based on enemy operations and the current/expected friendly order of battle. The friendly order of battle includes bases, units, aircraft, mission types, call signs, etc., and incorporates the identification friend or foe/selective identification feature plan. Enemy Order of Battle. Provide a reference to the intelligence annex of the governing plan and/or a top-level summary of pertinent intelligence data, including information on the following: • Composition, location, disposition, movements, and strengths of major enemy forces that can influence action in the operational area. • Definition of threat axes, DCA operations, known weapons of mass destruction (WMD), and estimated enemy course of action (COA). • Known intelligence preparation of the battlespace (IPB) for the operational area. • Enemy vulnerabilities, center of gravity (COG), and decisive points. Friendly Order of Battle. State information on friendly forces assigned. • Describe friendly Air Defense (AD) forces, including Command and Control (C2), aircraft (including counterair, reconnaissance, surveillance, and support), location of SAM units, and support forces. • Describe missile defense forces, including those with both air and missile defense (AMD) capabilities. • Describe Ballistic Missile (BM) defense system capabilities if any are located within the Operational Area (OA) or can support the Force Commander (FC). Non-Allied Forces • Describe neutral forces and AD capabilities in or near the theater that could impact operations. Include general statement and any specific information about COAs and					X	N/A	N/A	N/A	High	High	High

				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
			Air Traffic Management and Marshalling are functions of Airspace Control. Airspace control may require a combination of positive control, procedural control, and real-time joint battle management to control the operational activity of the joint force including strict constraints on the forces, weapons, and tactics employed. Depending on the mission, ROE, and weapons engagement zones, the degree of control of air assets may need to be rigorous, close, and restrictive, especially in an operational environment that can transition quickly from combat to noncombat and back again. Airspace control procedures and objectives include: • Enhance effectiveness in accomplishing the joint force commander’s objectives. • Prevent mutual interference. • Facilitate air defense identification. • Safely accommodate and expedite the flow of all air traffic in the operational area. • Prevent friendly fire. • Facilitate dynamic targeting. Additionally, airspace control planning should include contingency operations to account for adversary interference. Such interference may inhibit positive control necessitating resort to procedural control. Marshalling entails the methods of airspace control employed to facilitate termination of platform air operations via return to base, cueing platforms on a prioritized basis, controlling their disposition and planning for landing whether on land or at sea.					X						
135	Department of the Navy - Specific	D.1.6.3 Air Traffic Management and Marshalling							N/A	N/A	N/A	Moderate	Moderate	Moderate
			of engaging in combat. Airspace control is provided to reduce the risk of friendly fire (fratricide) or collateral damage to friends or neutrals, enhance air defense operations, and permit greater flexibility of operations. The Joint Force Commander (JFC) will determine the degree of airspace control required in the joint operations area (JOA). Depending on the mission, Rules of Engagement (ROE), and weapons engagement zones, the degree of control of air assets may need to be rigorous, close, and restrictive, especially in an operational environment that can transition quickly from combat to noncombat and back again. There are two methods of Airspace Control: Positive Control and Procedural Control. Positive Control positively identifies, tracks, and directs air assets using: • Radars • Other senses • Identification, friend or foe • Selective identification feature • Digital data links • Other elements of the communications system Procedural Control relies on previously agreed to and distributed control procedures and measures such as: • Comprehensive air defense identification procedures and rules of engagement • Airspace coordinating measures • Aircraft identification maneuvers • Fire support coordination measures • Maneuver control measures					X

139	Department of the Navy - Specific	D.1.6.7 Altimeter	An altimeter is a device that measures the relative position of a platform with respect to the surface of the earth. The information may be used as an aviation navigational aid or used for triggering an ordinance device.					X	N/A	N/A	N/A	Low	Moderate	Moderate
140	Department of the Navy - Specific	D.1.6.8 Tactical Video	Tactical video is video specifically designed and used for combat operations. Tactical video may be used on the same platform the sensor is mounted on or may be captured on a remote platform and relayed to another where it is analyzed, used for tactical combat decisions or stored as a record of tactical operations.					X	N/A	N/A	N/A	Moderate	Moderate	High
141	Department of the Navy - Specific	D.1.6.9 Communications Plan	Communications system planners are responsible for ensuring that the organization’s communications network can facilitate a rapid, unconstrained flow of information from its source through intermediate collection and processing nodes to its delivery to the user. Communications system planners should clearly understand the capabilities and limitations of all potentially available strategic, operational, and tactical communications systems and equipment, whether they are organic to Services and agencies, belong to non-US forces, are commercial, or provided by a host nation. Typically, the combined system will provide voice, data, and video communications. Building the communications system to support the JFC requires knowledge of the joint force organization, the commander’s concept of operations, communications available, and how they are employed. The J-6 is responsible for providing input to orders and plans, publishing guidance, coordinating communications system support and services, and gaining accreditation of joint force networks. The primary document for publishing communications system guidance is the annex K (communications supplement/instructions) of the basic order. After the communications system plan is developed and approved, the J-6 must ensure all networks receive appropriate accreditation.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
142	Department of the Navy - Specific	D.1.6.10 Geodesy	Geodesy is the science of accurately measuring and understanding the Earth's geometric shape, orientation in space, and gravity field. Operational planning and execution of tasks require digital maps, terrain data, and imagery to be loaded for each mission. Mission support information will include National Geospatial-Intelligence Agency (NGA) maps and imagery products or their digital equivalents based on mission specific geospatial intelligence features required. Cartographic material, digital geospatial intelligence data as derived from digital map and imagery features) or geodetic data support identified to support mission planning and onboard digital terrain and height data bases operate using standardized NGA data evolved from current specifications that are refined through robust performance assessments to fulfill anticipated future parameters.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
143	Department of the Navy - Specific	D.1.6.11 Mission Download	Specific missions and capabilities will drive the level of centralized control required for operations, and the extent that mission-type orders may be used. As an example, close air support (CAS) and personnel recovery (PR) missions typically have a high degree of uncertainty and complexity, and therefore require greater latitude in mission tasking and a higher degree of decentralized execution. Highly sensitive strike missions against long range strategic targets will generally require a higher level of detailed planning and centralized control. Joint Mission Planning System (JMPS) provides support for unit-level mission planning for the departure, ingress, objective-area, egress, and recovery phases of a mission. The system also provides support for mission planning from receipt of tasking, to development of an initial concept, through deconfliction and coordination of all elements and from launch to recovery. Continuing with the example of aviation mission planning, to a certain degree tactical control (TACON) over air warfare forces made available for tasking is decentralized. In the case of the FA-18E/F, the AN/ASQ-215 Digital Data Set provides the capability to do Mission Data Loading. It employs PCMCIA Data Transfer Module Units to convey mission planning data downloaded from the JMPS to the aircraft.					X	N/A	N/A	N/A	High	High	High
144	Department of the Navy - Specific	D.1.6.12 Dynamic Mission retasking	Dynamic retasking of a UAS should be done by the governing C2 agency and only after evaluating the full impact of diverting the capability from the current mission and the impact to operational success or consequences without the asset. PED, which includes specific, well-defined essential elements of information and reporting instructions, must be considered and coordinated when dynamically retasking UASs					X	N/A	N/A	N/A	High	High	High

				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
145	Department of the Navy - Specific	D.1.6.13 Tactical Command Information Exchange System (OTCIXS)	Fleet Satellite Communications (FLTSATCOM) provides the primary means of Navy tactical satellite ship-shore-ship communications over the officer in tactical command information exchange subsystem (OTCIXS) and the tactical data exchange subsystem (TADIXS). The common user digital information exchange system (CUDIXS) and the naval modular automated communications system (NAVMACS) combine to form a general-service message traffic network. OTCIXS Radio Frequency (RF) links carry teletypewriter traffic and data-link communications for tactical operations.					X	N/A	N/A	N/A	High	High	Moderate
146	Department of the Navy - Specific	D.1.6.14 Common Operational Picture (COP)	The combatant commander uses the common operational picture (COP) and common tactical picture (CTP) for theater situational awareness. The primary method for information sharing, gaining situational awareness, and supporting collaborative planning in the maritime domain is through development and maintenance of a global maritime COP inclusive of both military and merchant shipping. Networking maritime regions and resources into a COP can present useful data in a form that supports a wide range of planning, decision, execution, and assessment requirements. This data can also support Geographic Combatant Commander (GCC) requirements to achieve an area of responsibility (AOR)-wide, single integrated COP. Fusion of sensors (and other sources) is also used to form a similar COP for the integrated air picture.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
147	Department of the Navy - Specific	D.1.6.15 OPOrder	An OPOrder is an Operations Order. The OPOrder is a plan format meant to assist subordinate units with the conduct of military operations. An OPORD describes the situation the unit faces, the mission of the unit, and what supporting activities the unit will conduct in order to achieve their commander's desired end state. The issuance of an OPrder triggers subordinate unit leadership to develop orders specific to the role or roles that the unit will assume within the operation. This more narrowly focused order borrows information from the original, or base, order (for example; weather, phase lines, radio frequencies, etc.) and adds additional details that pertain more to the minutiae of the actions a unit is tasked to conduct in support of the overarching operation. An OPOrder is formatted to organize an operation into five easily understood paragraphs: Situation, Mission, Execution, Sustainment (formerly Service and Support, currently referred to as Admin & Logistics by the US Marine Corps), and Command and Control. Higher echelon's OPORDs often contain extensive details					X	N/A	N/A	N/A	High	Moderate	Moderate

				EIEMA	WMA	BMA	DIMA	All	C	I	A	C	I	A
157	Department of the Navy - Specific	D.1.7.2. Targeting-Engagement Coordination	Target engagement coordination is the information or information exchange required to issue engagement authority or to execute engagement of a target. DON uses the term “engagement” in association with target acquisition. Acquisition supports target identification (ID), discrimination, and timely engagement by accurately locating and monitoring targets and transmitting information relative to their movements. A target engaged is under track and/or the weapon has developed a solution for successful completion of mission but the weapon has not been released. Depending on emissions and observable kinematics, engagement may be detectable by the enemy and considered a hostile act escalating a scenario. Caution: other components may use the term “engagement” to describe the condition existing post release of a kinetic weapon against a target; i.e. missile launched against the target.					X	N/A	N/A	N/A	High	High	Moderate
158	Department of the Navy - Specific	D.1.7.3 Weapons Control	Weapons control procedures [as a part of Air Defense (AD)] and airspace control procedures are required all AD weapon systems and forces. These procedures must facilitate Defensive Counter Air (DCA) operations while minimizing the risk of friendly fire. DCA operations require not only the integration of all appropriate DCA forces/capabilities within a theater/ joint operations area (JOA), but also their efficient and effective employment to protect selected assets and forces from attack. These operations are subject to the weapons control procedures established by the Area Air Defense Commander (AADC). When possible, the AADC should design a layered defense that includes weapons control procedures to allow multiple engagement opportunities for friendly forces and includes the following: Area Defense, Point Defense, Self-Defense and High Value Airborne Assets (HVAA) Protection.					X	N/A	N/A	N/A	High	High	Moderate
159	Department of the Navy - Specific	D.1.7.4 AIM Point (Laser Designator and Ranging)	Special Operations Forces (SOF) core operations and activities should be considered when planning counterair operations. SOF can aid counterair operations by providing information or by destroying or disrupting air and missile assets, bases, logistic sites, and C2 facilities. For example, SOF can locate enemy assets (especially those being concealed/camouflaged) behind the lines, provide terminal guidance (e.g., laser target designation) for joint air attacks, and provide post-attack assessment. They may be used for Offensive Counter Air (OCA) operations, but they are not a recognized Defensive Counter Air (DCA) asset. Additionally, autonomous units (including infantry) may use handheld laser devices for the purposes of measuring range and/or designating targets or aiming handheld weapons.					X	N/A	N/A	N/A	High	High	Moderate
160	Department of the Navy - Specific	D.1.7.5 Terminal Guidance	Terminal guidance information is information used to ensure the effective placement of kinetic effects on selected targets. Kinetic weapons may receive signals providing instructions for course correction, stabilization or precision maneuvering to a designated target. This may include illumination with radio frequency (RF) signals or light (such as laser). It may also include self-destruction orders to abort an attack. Kinetic weapons in the theater of operations may range from standard missiles to man mounted and fired weapons.					X	N/A	N/A	N/A	Moderate	High	Moderate
161	Department of the Navy - Specific	D.1.8 Maritime Surveillance												
162	Department of the Navy - Specific	D.1.8.1 INMARSAT	INMARSAT is one of the narrow band and mobile service available to the fleet to provide bulk use and pay-per-use alternatives that support information transfer requirements during both normal operations and periods of contingency or crisis. INMARSAT does not provide the survivability, Low Probability of Intercept (LPI), or antijam capabilities required in tactical applications. It may be subject to electromagnetic interference (EMI), jamming, or intrusion.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
163	Department of the Navy - Specific	D.1.8.2 VHF LOS (Sonobuoy Receiver Subsystem (SRS))	Very High Frequency Line-of-sight (VHF LOS) signals. The Sonobuoy systems node represents the interface between the P-8A acoustic subsystem and any number of deployable sonobuoy types (represented as “systems”), including the planned HAASW modified sonobuoys. The system interface is a “key interface” as sonobuoys are a critical element in P-8A ASW missions. The interface provides for both downlink of sonobuoy commands and uplink of sonobuoy data.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
164	Department of the Navy - Specific	D.1.8.3 Maritime Satellite	Narrowband and mobile services provide phone and data transfer capability for netted, mobile, hand-held, paging, and low speed broadcast. Some of the Global Information Grid’s (GIG)’s key systems in this category include military-owned fleet satellite communications (FLTSATCOM), Ultrahigh Frequency Follow-on (UFO), and commercially available mobile satellite service such as international maritime satellite (INMARSAT) and Iridium. 165	Department of the Navy - Specific	D.1.8.4 Integrated Broadcast Service (IBS)	The Integrated Broadcast Service (IBS) fulfills the warfighter's requirements for worldwide threat warning and situational awareness information with timely production and simultaneous dissemination of Intelligence, Surveillance, and Reconnaissance (ISR) derived combat information. It also provides target tracking data to support threat avoidance, targeting, force protection, and situational awareness. This information is continually refined in near real time by strategic, operational and tactical sensors					X	N/A	N/A	N/A	High	Moderate	Moderate
166	Department of the Navy - Specific	D.1.8.4.1 Radiant ETHER	SIPRNet Radiant ETHER (capability for direct Integrated Broadcast Services (IBS) receipt via Satellite Communications (SATCOM). Aircraft crew has available to them situational awareness data received through the Integrated Broadcast Service (IBS) through Internet protocol (IP) means via Radiant ETHER and a growth capability to receive IBS information directly through ultrahigh frequency (UHF) SATCOM [IBS-Simplex (IBS-S) and IBS-Interactive (IBS-I)]. This information will include Electronic Support Measures (ESM), radar, imagery and visual contact data all supporting the identification of friendly and enemy units and the development of a targeting solution. Integrated Broadcast System Support Office (IBSSO) provides an IP-based intelligence information source over SIPRNet called Radiant ETHER. P-8A baseline design will provide Radiant ETHER receive-only functionality using INMARSAT/WGS-SIPRNet. Similar to NETPREC, receipt of Radiant ETHER information requires two-way connectivity to support network participation. EMCOM conditions may restrict network usage and consequently, limit access to Radiant ETHER information. Once the revised P-8A CONOPS have been finalized, the impact of limited Radiant ETHER access will be assessed for those scenarios requiring restricted Emissions Control (EMCON). 167	Department of the Navy - Specific	D.1.8.4.2 IBS- Common Interactive Broadcast	Common Interactive Broadcast is a subset of the Integrated Broadcast Service (IBS). IBS fulfills the warfighter's requirements for worldwide threat warning and situational awareness information with timely production and simultaneous dissemination of Intelligence, Surveillance, and Reconnaissance (ISR) derived combat information. It also provides target tracking data to support threat avoidance, targeting, force protection, and situational awareness.					X	N/A	N/A	N/A	High	Moderate	Moderate
168	Department of the Navy - Specific	D.1.8.5 Slot Buoy (aggregated systems node)	The Slot Buoy node is essentially identical to the Sonobuoy node. In fact, the communications channels are identical; however, the content of the data is very different and hence slot buoys are assigned a separate interface identifier. Slot buoys are used by friendly force submarines to convey essential information. The interface with P-8A is a "key interface.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
169	Department of the Navy - Specific	D.1.8.6 Refueling Tanker Aircraft (aggregated systems node)	The Refueling Tanker Aircraft node covers the interfaces required to support the refueling of the P-8A by refueling tanker aircraft. It is one of the Other Consumer/Producer (OCP) aggregated systems node which captures miscellaneous non-Carrier Strike Group/Expeditionary Strike Group/Surface Strike Group (CSG/ESG/SSG) units that produce information for or consume information from P-8A.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
170	Department of the Navy - Specific	D.1.8.7 Guided Weapons (agregated systems node)	The Guided Weapons systems node covers P-8A control of guided weapons (e.g., Network-Enabled Weapons (NEW)) and receipt of data (e.g., status, seeker video) from the weapon if available. . It is one of the Other Consumer/Producer (OCP) aggregated systems node which captures miscellaneous non-Carrier Strike Group/Expeditionary Strike Group/Surface Strike Group (CSG/ESG/SSG) units that produce information for or consume information from P-8A.					X	N/A	N/A	N/A	Moderate	Moderate	Moderate
171	Department of the Navy - Specific	D.1.8.8 CENTRIXS	The Combined Enterprise Regional Information Exchange System (CENTRIXS) is a collection of classified coalition networks, called enclaves, which enable information sharing through the use of email and Web services, instant messaging or chat, the Common Operational Picture service, and Voice over IP.
